

What, if any, mobile applications were you using at the time of the incident? Did they provide you with any further information about the aircraft's behavior? (i.e. warnings or status)

only application I was using was the DJI Go App. The application change status to Critical Error and at one point it said NO GPS. The GPS icon was grayed out. satellite positioning off.

What, if any, non-DJI products were you using at the time of the incident?

The only not DJI Product I was using was the device I use ~~to~~ to run your Application. (Samsung Phone)

Please list any links to video or photo evidence of the incident:

I uploaded flight history. only available video was last 20 seconds

Please list any further information that was not covered about that you feel is essential to figuring out why the aircraft behaved as it did:

The Aircraft did not engage in Return home command. "failed" GPS just turned off and there was no way to get it to work. Lights were solid Red when the Aircraft started to not respond.

Please help. all my savings. where used to upgrade to this Phantom 4. (I have been flying with DJI since the first Phantom).

Even without GPS it will not respond it was going up and Down and away ~~up~~ even without touching Remote.
